

Unit-Data Vs LeadData

Core Difference

Unit-Data (production) = stable, strict, rule-based **Unit-LeadData (planning)** = experimental, flexible, growth-oriented

◆ 1. Unit-Data [PRODUCTION]

👉 This already exists in your system (based on your structure and rules)

From your setup (see):

- Uses `input/data.json`
 - Uses `input/data.schema.json`
 - Strict path system (`OUTPUT_ROOT`)
 - Controlled by `meta.json` (status, skip, lock)
-

Purpose

“Provide clean, structured, reliable data for video generation”

Characteristics

✓ Stable

- schema fixed
- predictable output

✓ Deterministic

- same input → same output

✓ Integrated

- tightly connected with:
 - Unit-Debate
 - Unit-Packaging
 - rendering pipeline
-

Output Type

structured video data

example:

- arguments
- segments
- metadata

👉 NOT leads 👉 NOT external business data

⊘ What it should NOT do

- ✗ scraping
 - ✗ API calling (dynamic sources)
 - ✗ lead collection
 - ✗ enrichment experiments
-

◆ 2. Unit-LeadData [PLANNING / NEW]

👉 This is what you are designing

🎯 Purpose

“Collect real-world business/user data from multiple sources”

⚙️ Characteristics

🔥 Dynamic

- APIs
- scraping
- directories

🔥 Non-deterministic

- results change
- depends on external data

🔥 Expandable

- new sources anytime
-

📦 Output Type

CSV datasets

- leads_raw.csv
 - leads_clean.csv
 - leads_enriched.csv
-

Data Nature

Type	Unit-Data	Unit-LeadData
Source	internal	external
Stability	high	variable
Format	strict	evolving
Use case	video pipeline business / content / monetization	

CRITICAL DESIGN RULE

✗ NEVER merge them

Bad idea:

Unit-Data → add scraping → leads → chaos

👉 This will break your whole CF2 pipeline

✓ Keep separation

Unit-Data → video system
Unit-LeadData → lead system

HOW THEY CONNECT (SMART WAY)

👉 They SHOULD connect — but indirectly

✓ Connection via Unit-Content

Unit-LeadData
↓
Unit-LeadIntelligence
↓
Unit-Content
↓
Unit-Data (optional input)

Example

1. LeadData:

- scrape “AI companies”

2. Intelligence:

- find top companies

3. Content:

- generate topic:

“Top AI Companies 2026”

4. Unit-Data:

- uses topic to generate structured debate/video

👉 So:

LeadData feeds ideas → Unit-Data produces structured content

☐ THINK LIKE THIS

Unit-Data = “Script Brain”

- structured
 - controlled
 - safe
-

Unit-LeadData = “Reality Scanner”

- messy
 - powerful
 - money-driven
-

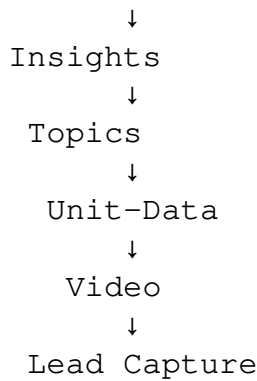

🔥 Practical Example (YOUR SYSTEM)

🎬 Your current system:

Topic → Unit-Data → Debate → Video

🚀 With Lead System:

Market Data → Unit-LeadData

FINAL POSITIONING (VERY IMPORTANT)

 Don't think:

“LeadData vs Data”

Think:

“LeadData → feeds → Data”

Clean Separation Summary

Unit-Data (Production Core)

- input-driven
 - schema strict
 - video-focused
 - stable
-

Unit-LeadData (Growth Engine)

- source-driven
 - flexible
 - business-focused
 - experimental
-

My Honest Advice

If you keep this separation:

 your system becomes **enterprise-level**

If you mix them:

☞ system becomes **fragile** + **unscalable**

🔥 If you want next step

I can design:

☞ exact **interface between LeadData → Unit-Data** ☞ how to auto-generate **topics from leads** ☞ how to turn leads into **viral debate scripts**
